

System interface within the company and with clients

Industry: Service (clinical specimen examination)

HULFT

Purpose of introducing HULFT products

Securely and smoothly link the enormous amount of specimen data generated every day between systems. Shorten the time it takes for the labs/head office/sales offices to share sales-related information with one another and to send test results to clients.

Issues prior to introducing HULFT products

Delivery management cannot be performed in the FTP-based receiving and sending of files. Manually performing before-and-after processing involves a considerable amount of time and effort.

Effect of introducing HULFT products

The receiving and sending of files have been standardized into HULFT on a company-wide basis. This has reduced the amount of effort and shortened the time needed to send and receive data to one-third of what it used to take.
